# A Summary of DPG

#### Overview of Features

- Robust for singularly perturbed problems
- Stable in the preasymptotic regime
- Designed for adaptive mesh refinement

#### DPG is a minimum residual method:

$$u_h = \underset{w_h \in U_h}{\arg \min} \frac{1}{2} \|Bw_h - I\|_{V'}^2$$

$$\downarrow \downarrow$$

$$b(u_h, R_V^{-1} B \delta u_h) = I(R_V^{-1} B \delta u_h) \quad \forall \delta u_h \in U_h$$

where  $v_{\delta u_h} := R_V^{-1} B \delta u_h$  are the optimal test functions.

### **DPG** for Convection-Diffusion

Start with the strong-form PDE.

$$\nabla \cdot (\beta u) - \epsilon \Delta u = g$$

Rewrite as a system of first-order equations.

$$abla \cdot (eta u - oldsymbol{\sigma}) = g$$
 $abla \cdot (eta u - oldsymbol{\sigma}) = \mathbf{0}$ 

Multiply by test functions and integrate by parts over each element, K.

$$-(\beta u - \sigma, \nabla v)_{K} + ((\beta u - \sigma) \cdot \mathbf{n}, v)_{\partial K} = (g, v)_{K}$$
$$\frac{1}{\epsilon} (\sigma, \tau)_{K} + (u, \nabla \cdot \tau)_{K} - (u, \tau_{n})_{\partial K} = 0$$

Use the ultraweak (DPG) formulation to obtain bilinear form b(u, v) = I(v).

$$-(\beta u - \sigma, \nabla v)_{K} + (\hat{f}, v)_{\partial K} + \frac{1}{\epsilon} (\sigma, \tau)_{K} + (u, \nabla \cdot \tau)_{K} - (\hat{u}, \tau_{n})_{\partial K} = (g, v)_{K}$$

### **Local Conservation**

The local conservation law in convection diffusion is

$$\int_{\partial K} \hat{f} = \int_K g,$$

which is equivalent to having  $\mathbf{v}_K := \{v, \tau\} = \{\mathbf{1}_K, \mathbf{0}\}$  in the test space. In general, this is not satisfied by the optimal test functions. Following Moro et al<sup>[2]</sup>, we can enforce this condition with Lagrange multipliers:

$$L(u_h, \lambda) = \frac{1}{2} \|R_V^{-1}(Bu_h - I)\|_V^2 - \sum_K \lambda_K \underbrace{\langle Bu_h - I, \mathbf{v}_K \rangle}_{\langle \hat{f}, 1_K \rangle_{\partial K} - \langle g, 1_K \rangle_K},$$

where  $\lambda = \{\lambda_1, \cdots, \lambda_N\}.$ 

#### **Local Conservation**

Finding the critical points of  $L(u, \lambda)$ , we get the following equations.

$$\frac{\partial L(u_h, \lambda)}{\partial u_h} = b(u_h, R_V^{-1} B \delta u_h) - I(R_V^{-1} B \delta u_h) - \sum_K \lambda_K b(\delta u_h, \mathbf{v}_K) = 0 \quad \forall \delta u_h \in U_h$$

$$\frac{\partial L(u_h, \boldsymbol{\lambda})}{\partial \lambda_K} = -b(u_h, \boldsymbol{v}_K) + I(\boldsymbol{v}_K) = 0 \quad \forall K$$

#### A few consequences:

- We've turned our minimization problem into a saddlepoint problem.
- Only need to find the optimal test function in the orthogonal complement of constants.

## **Optimal Test Functions**

For each  $\mathbf{u} = \{u, \sigma, \hat{u}, \hat{t}\} \in \mathbf{U}_h$ , find  $\mathbf{v}_{\mathbf{u}} = \{v_{\mathbf{u}}, \boldsymbol{\tau}_{\mathbf{u}}\} \in \mathbf{V}$  such that  $(\mathbf{v}_{\mathbf{u}}, \mathbf{w})_{\mathbf{V}} = b(\mathbf{u}, \mathbf{w}) \quad \forall \mathbf{w} \in \mathbf{V}$ 

where **V** becomes  $\mathbf{V}_{p+\Delta p}$  in order to make this computationally tractable. Chan et al<sup>[1]</sup> developed the following robust norm for convection-diffusion.

$$\begin{aligned} \|(v,\tau)\|_{\mathbf{V},\Omega_h}^2 &= \|\nabla\cdot\tau\|^2 + \left\|\min\left\{\frac{1}{\sqrt{\epsilon}},\frac{1}{\sqrt{|K|}}\right\}\tau\right\|^2 \\ &+ \epsilon \left\|\nabla v\right\|^2 + \|\boldsymbol{\beta}\cdot\nabla v\|^2 + \left\|\min\left\{\sqrt{\frac{\epsilon}{|K|}},1\right\}v\right\|^2 \end{aligned}$$

# **Optimal Test Functions**

For each  $\mathbf{u} = \{u, \sigma, \hat{u}, \hat{t}\} \in \mathbf{U}_h$ , find  $\mathbf{v}_{\mathbf{u}} = \{v_{\mathbf{u}}, \boldsymbol{\tau}_{\mathbf{u}}\} \in \mathbf{V}$  such that  $(\mathbf{v}_{\mathbf{u}}, \mathbf{w})_{\mathbf{V}} = b(\mathbf{u}, \mathbf{w}) \quad \forall \mathbf{w} \in \mathbf{V}$ 

where **V** becomes  $\mathbf{V}_{p+\Delta p}$  in order to make this computationally tractable. Chan et al<sup>[1]</sup> developed the following robust norm for convection-diffusion.

$$\|(\boldsymbol{v}, \boldsymbol{\tau})\|_{\mathbf{V}, \Omega_h}^2 = \|\nabla \cdot \boldsymbol{\tau}\|^2 + \left\|\min\left\{\frac{1}{\sqrt{\epsilon}}, \frac{1}{\sqrt{|K|}}\right\} \boldsymbol{\tau}\right\|^2 + \epsilon \|\nabla \boldsymbol{v}\|^2 + \|\boldsymbol{\beta} \cdot \nabla \boldsymbol{v}\|^2 + \left(\frac{1}{|K|} \int_{K} \boldsymbol{v}\right)^2$$
zero mean term

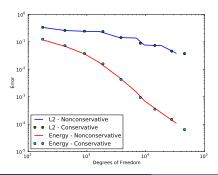

#### Erickson-Johnson Problem

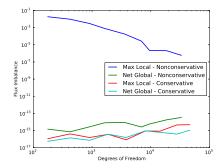

On domain  $\Omega = [0, 1]^2$ , with  $\beta = (1, 0)^T$ , f = 0 and boundary conditions

$$\hat{f} = u_0, \quad \beta_n \leq 0, \qquad \hat{u} = 0, \quad \beta_n > 0$$

Separation of variabes gives an analytic solution

$$u(x,y) = C_0 + \sum_{n=1}^{\infty} C_n \frac{\exp(r_2(x-1)) - \exp(r_1(x-1))}{r_1 \exp(-r_2) - r_2 \exp(-r_1)} \cos(n\pi y)$$
